PREFACE

This project report documents the significant issue of distracted driving and its adverse effects on road safety. It provides a comprehensive account of our substantial research and development endeavours in this field.The main goal was to create a robust Driver Monitoring System (DMS) by employing advanced computer vision and deep learning techniques. This study seeks to enhance driver safety measures by presenting a comprehensive account of our project's objectives, methodologies, and significant discoveries.

My research aimed to create a dependable system capable of detecting driver distractions and issuing timely warnings through thorough testing and analysis. My methodology encompassed data collection, pre-processing, model selection, and training, wherein we utilised high-quality, pre-trained deep learning models. The findings of our experiment demonstrate that driver monitoring systems that integrate deep learning and computer vision are highly successful and hold great potential for the future.

I express our profound gratitude to those individuals and organisation whose assistance, guidance,and resources were indispensable to the accomplishment of the project. With their invaluable support,we successfully completed the project. Additionally, we anticipate that the discoveries will stimulate further investigation in this domain and contribute to the discourse on overall driver safety.
